

Week 2

Water Testing & Plants

Task:

Cut out the below tiles, and stick them in the correct order of the Nitrogen Cycle.

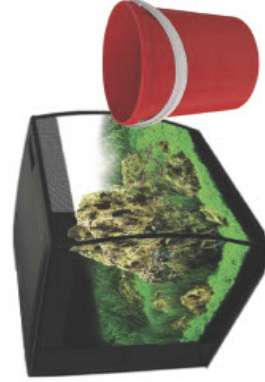

This ammonia makes your fish very sick! You need to remove it quickly.

Nitrites are not as bad as ammonia but will still make fish sick. Nitrate won't make fish sick as long as there isn't a lot of it.

You then carry out water changes to remove the nitrate from the water.

This is your fish!

You feed your fish, food. Through their waste they produce harmful ammonia.

The liquid helps fight the bad ammonia. It splits it into nitrites then into nitrites.
